

DO YOU HAVE BLACK MOLD OR FUNGUS GROWING ON YOUR ROOF?

Black mold and fungus growing on a roof should not be ignored. Fungus releases spores and other allergens that impact indoor air quality. People living or working in environments with mold or fungus present can suffer from hay fever-like symptoms or other more serious health problems. Roofs containing mold and/or fungus are more likely to eventually have their indoor air quality contaminated with mold spores which can be a dangerous and expensive problem. As the fungus grows on the outside of the roof, it eats away the base of the shingle and expands and contracts with the outside air temperature. This growth and movement loosens the granules, dramatically shortening the life of your roof. Moss growing on a roof causes the shingle tabs to raise allowing water, ice, and rain underneath. The wind will blow off the tab causing expensive exterior roof repairs. Water under the shingle tab will enter the house and cause interior ceiling damage resulting in expensive interior repairs. Professional power washing and cleaning with commercial grade cleaning agents that safely loosen and remove the organisms causing the roof stains is safe and effective on wood, slate, concrete, vinyl siding, and virtually any hard surface. This process will not damage nearby vegetation and will not contaminate the environment.

- OUR ROOF RESTORATION SERVICES & LONG-TERM EXTERIOR MAINTENANCE PROGRAMS WILL EXTEND THE LIFE OF YOUR EXISTING ROOF.
- FAMILY-OWNED CONTRACTING COMPANY WITH 25+ YEARS OF EXPERIENCE.
- SPECIALIZING IN ALL TYPES OF RESIDENTIAL & COMMERCIAL ROOFING.
- REPAIR SPECIALIST ADDRESSING ALL ROOF SYSTEMS INCLUDING SLATE.
- LEAK INVESTIGATION ON ALL EXTERIOR & MASONRY BUILDING ISSUES.
